SUMMARY

Computer Science graduate and former ML intern at Notzero Technologies, where I built a **payment-retry planner that recovered 31% more revenue** in simulation. I build ML for fintech and ship it as working software, including a **loan-default risk engine trained on 255K loans**. Strong in tabular ML, forecasting and explainable AI; expanding into NLP and LLM applications.

EXPERIENCE

Machine Learning Intern — Notzero Technologies, Nigeria (Hybrid) Mar 2026 – Sep 2026

- Built **Recoup**, a failed-payment recovery system that decides when to retry a failed subscription payment, how many times, and when to ask for a new card, replacing the fixed “retry after 1, 3 and 7 days” rule most businesses use ([GitHub](#)).
- Modeled the chance that each customer can pay at each retry time using probabilistic models in Python and SciPy, sharing what is learned across merchants so small businesses with little history also benefit.
- In simulation, recovered **31% more revenue per failed payment** than the fixed rule (\$15.93 vs. \$12.12), with gains of 20 – 35% across six stress-test scenarios and +19% for small merchants.
- Added a safety gate that blocks rollout until real-world evidence confirms the gain, so the business never bets revenue on an unproven model.

TECHNICAL SKILLS

- Languages & Tools:** Python, SQL, Git/GitHub, GitHub Actions (CI), Jupyter
- Machine Learning:** scikit-learn, LightGBM, XGBoost, CatBoost, Optuna, SHAP, model calibration, cost-sensitive decisions
- Deep Learning & NLP:** PyTorch (GRU, LSTM), TF-IDF, embeddings, text classification
- Forecasting & Statistics:** time-series forecasting (ARIMA, GARCH), Bayesian modeling, bandit-based experimentation
- Deployment & Data:** Flask REST APIs, pytest, model versioning, Streamlit, Gradio, pandas, NumPy, Plotly

PROJECTS

Can I borrow.ai: Loan Default Risk Engine | *LightGBM, scikit-learn, SHAP, Flask, pytest* [GitHub](#)

- Built an end-to-end system that predicts whether a borrower will default, trained on 255K consumer loans, with a pipeline that produces versioned, auditable models and auto-generated model cards.
- Reached **ROC-AUC 0.76** on 51K unseen loans with **well-calibrated risk estimates** (predicted default rate 11.70% vs. actual 11.61%); a cost-tuned approval threshold **catches 80% of defaults**.
- Explains every decision with the top reasons behind it (SHAP), keeps protected attributes out of the model, checks for unfair outcomes on every run, and serves it all through a Flask API and web app.

DSN Bootcamp Qualification Hackathon 2026: Placed 40th | *Kaggle, LightGBM, XGBoost, CatBoost, CI* [GitHub](#)

- Predicted retail product sales; found that a simple, explainable store-level model (**RMSE 1,070.8**) beat tuned LightGBM, XGBoost and CatBoost (1,097–1,101) under repeated cross-validation.
- Cut error on never-seen stores by 18% and shipped 80% prediction ranges (79.7% actual coverage) as a tested Python package with GitHub Actions CI.

CrediPulse: Explainable Credit Scoring Platform | *LightGBM, Optuna, SHAP, Flask, JavaScript* [GitHub](#)

- Tuned a LightGBM credit model (**ROC-AUC 0.81**) and built a web app that gives each applicant a 300–850 score, an approve/decline decision, the reasons behind it, and bulk CSV scoring.

Financial Time-Series Forecasting: Oil, Inflation & FX | *statsmodels, LightGBM, PyTorch* [GitHub](#)

- Forecast oil-price volatility over 39 years of data with **4.6% error vs. 60% for the classical GARCH model**; also built LSTM/GRU models in PyTorch for inflation and currency forecasting.

Deal Desk: Creator Brand-Deal Platform (MVP) | *Flask, Google OAuth, YouTube API, pytest* [GitHub](#)

- Built a SaaS MVP that connects a creator’s YouTube account, tracks sponsored-post performance against their normal baseline and generates shareable PDF reports for brands.

EDUCATION

Covenant University — B.Sc. Computer Science

2021 – 2025
